TITLE: Application of Designs on Rubber Boots (Naneseniye risunka na tsvetnyye rezinovyie sapozhki)

PERIODICAL: Kauchuk i Rezina, 1958, Nr 8, p 36 (USSR)

ABSTRACT: Previous methods of applying designs by typographic methods and special transfers are mentioned. The authors used this latter method and applied the adhesive "Nairit" on a 6% natural rubber solution and subsequent vulcanisation. The colour of dyes change slightly during vulcanisation. Satisfactory results were obtained when the designs were applied on non-vulcanised rubber with offset colours. After vulcanisation it is recommended to apply colourless lacquer based on SKB rubber. There is 1 Picture.

"Orientation of Pictures on STD-1 by Using Four Altitude Points From Camera Determination of the Main Point of the Right Picture of the Stereocouple"

Sb. ref. Tsent. n-i. in-ta geod., aeros'yemki i kartogr. No 1, 1954, 50-51

The method consists in the approximate orientation of the stereocouple tolerating 0.05 to 0.10 mm errors. The measured discrepancies of longitudinal parallaxes are used to fix the main point on the right picture as mean arithmetic of the two determinations. Thereafter the discrepancies of longitudinal parallaxes of basic points are established in relation to the main point of the right and the stereocouple definitively oriented. (RZhAstr, No 10, 1955)

(Trends in the Development of the Gas Industry in the USSR; Materials Presented
at the All-Union Conference) Moscow, Gostoptekhnizdat, 1958. 432 p. 3,000
copies printed.

Eds: A.D. Brents, B.S. Itsiksen, P.G. Komissarov, Ye.A. Krems, V.I. Popov,
V.N. Raaben, N.I. Ryabtsev, P.A. Tasner, A.S. Pal'kevich; **Exec. Eds.:**
N.I. Stepanchenko and M.M. Nevikova; **Tech. Ed.:** E.A. Makhina;
Editorial Board: M.V. Sidorenko (Chief Ed.), K.S. Zarembo, Ye.A. Krems,
V.N. Raaben, and N.I. Ryabtsev.

PURPOSE: The book is intended for specialists engaged in the production and
gathering of natural gas, the extraction of gas from coal and shale, the con-
struction and operation of trunk gas pipelines, gas supply to cities, and the
processing of gas.

Card 1/11

Trends in the Development of the Gas (Cont.)

SOV/1868

COVERAGE: The authors review the basic trends in the development of the USSR gas industry, the prospecting and exploration of new gas deposits, the gasification of solid fuels, the gathering and utilization of natural gas, the automation of gas field operations, the exploitation of gas wells, and ways to increase output. They further discuss the processing of natural gas with application of refrigeration, the experience gained in the laying and operating of trunk gas pipelines, the automation of gas pipeline operation, and underground gas storage facilities. There are no references.

Gazosnabzheniye vostochnykh rayonov SSSR na osnove gazifikatsii tverdykh topliv (Supplying the Eastern Regions of the USSR With Gas Produced by Solid Fuel Gasification) Moscow, Gostoptekhizdat, 1959. 214 p. 2,000 copies printed.

Ed.: N.V. Shishakov, Doctor of Technical Sciences; Executive Ed.: T. D. Yefremova; Tech. Ed.: A.V. Trofimov.

PURPOSE: This collection of articles is intended for designing, planning, and scientific research personnel, as well as for engineers, technicians, and students specializing in solid fuel gasification.

COVERAGE: This collection of articles describes the problem of supplying the eastern regions of the USSR with synthetic gas derived from the gasification of solid fuels to overcome that area's lack of natural gas. Individual articles discuss the distribution of the region's coal deposits, the quality and types of coal encountered, gasification process, and the economics involved in the production and supply of the synthetic gas product. The author thanks V.S. Al'tshuler, Doctor of Technical Sciences. References accompany each article.

Flux for copper soldering of cutting tools

Periodical : Stan. 1 instr. 2, page 37, Feb 1954

Abstract : A new highly effective flux VL-1 for copper soldering of cutting tools is briefly described. The mechanical mixture of the flux consists of finely ground fused borax sifted through a 30 mesh sieve and 10% copper phosphide pulverized for sifting through a 70 mesh sieve. The results obtained with the VL-1 flux are tabulated. Table.

AUTHORS: Usachev, P.V., Golubkov, A.V., and Volosamova, I.S.

TITLE: Synthesis of HgSe and HgTe

PERIODICAL: Zhurnal prikladnoy khimii, v. 33, no. 12, 1960,
2771 - 2772

TEXT: Since little information has been published on the synthesis of HgSe and HgTe, this question is considered in some detail by the authors. Examination of the relevant literature shows that methods for synthesizing HgSe and HgTe were respectively developed by A.I. Blum et al (Ref. 1: Zh. tekhn. fiziki, 21, 316, 1951) and E.I. Nikol'skaya et al (Ref. 2: Zh. tekhn. fiziki, 25, 1347, 1955). Certain aspects of the preparation of HgTe have also been studied by O.D. Elpat'yevskaya et al (Ref. 3: Zh. tekhn. fiziki, 26, 2154, 1956) and I.M. Tsidilkovskiy (Ref. 4: Zh. tekhn. fiziki, 27, 1744, 1957), while R.O. Carlson and other scientists have devised a modified process for obtaining this compound. The basic materials are

Card 1/3

S/080/60/033/012/017/024
D209/D305

Synthesis of HgSe and HgTe

Se, processed Te and purified Hg. The experimental apparatus consists of a thick-walled ampoule with a capacity of 35 - 40 cm³, a length of 110 mm, an inner diameter of 20 mm and an internal pressure of about 40 atm. After insertion of the powdered Te and Se and Hg amalgam the ampoule is placed horizontally inside a stout copper vessel in the furnace, the apertures of the copper vessel and furnace being sealed with asbestos for heat-insulation. In the case of HgSe the ampoule temperature is brought to 800° for 6 - 8 hours and is then cooled after a 20 - 30 minute period of soaking; a temperature of 675° is required for the formation of HgTe. The selenide and telluride thus obtained have a glistening color, the former substance being slightly darker with a bluish hue. Their respective melting points are 793° and 667°. In the opinion of the authors there are three points worthy of further consideration. The first and most important is the need for ~~the~~ fine grinding of Se and Te to ensure their reaction with Hg, although this may entail the risk of their slight oxidation during pulverization. Tests conducted by the authors, however, indicate that the essential properties

Card 2/3

Synthesis of HgSe and HgTe

25660

S/080/60/033/012/017/024
D209/D305

of HgTe -- its electroconductivity and thermoelectromotive force -- prepared from both coarse and powdered Te are almost identical. Secondly, the horizontal position of the ampoule prevents any fracturing that might result from the increase in volume of the reaction mixture at a temperature of 200 - 500°. The third feature is the appearance of small amounts of mercury after the heating and cooling of the chalcide in consequence of the uneven temperature inside the ampoule. During the reaction this gaseous mercury both inhibits the dissociation and vaporization of the chalcide and restricts its secretion. Free mercury is not detected in reactors with no temperature gradient. Decomposition of HgSe and HgTe can also be avoided by introducing a small quantity of Hg into the heated ampoule. TITLE: A device for broadcasting pesticides and meliorating substances. Class 45, No. 166787 [announced by All-Union Scientific Research Institute for Mechanization of Agriculture (Vsesoyuznyy nauchno-issledovatel'skiy institut mekhanizatsii sel'skogo khozyaystva)]

SOURCE: Izobreteniya, promyshlennyye obraztsy, tovarnyye znaki, no. 19, 1966, 109

TOPIC TAGS: agricultural machinery, agricultural engineering, broadcasting operation, pesticide, fertiliser

ABSTRACT: This Author Certificate presents a device for broadcasting pesticides and meliorating substances. The device contains a tank divided into sections, broadcasting mechanisms, receiving chambers of the fertilizer duct, and a driving mechanism. To provide for a uniform broadcasting of a material, the broadcasting mechanisms are made in the shape of cones mounted on a common shaft carrying a spiral with the opposite direction of coil loops. Every revolving cone may be spring loaded and may

PHASE I BOOK EXPLOITATION

SOV/3191

Volosatov, Viktor Alekseyevich

Konstruktsii universal'nykh pnevmaticheskikh prispособleniy (Design of Universal Pneumatic Fixtures) [Leningrad] Lenizdat, 1959. 190 p. 3,000 copies printed.

Ed.: S. I. Borshchevskaya; Tech. Ed.: L. G. Levonevskaya.

PURPOSE: This book is intended for qualified workers, designers, and engineers of metalworking plants operating in the field of industrial production machinery.

COVERAGE: The data in this book are based on the experiments of Leningrad factories. The book considers the designs of universal pneumatic fixtures for basic types of metal-cutting machine tools, such as lathes, turret lathes, milling machines, drills, and planers. It also describes labor-saving devices for mechanization of manual and bench work. The author expresses his gratitude to the engineers in the Leningrad factories—V. A. Druzhinin, B. G. Distfel'd, M. Z. Zapol'skikh, and V. I. Platonov—for their help in selecting the material for the book. There are 10 Soviet references.

ABSTRACT:

This is a book review. The author has written this valuable
book backed by his long engineering and teaching experience.
It can be used by students and by engineers working in the
electrification of agriculture. It may come in useful also for
extension courses. It is very well arranged, and all basic
chapters of the course have been given ample space. The subject
is discussed from the viewpoint of modern engineering solutions.

SOV/105-59-6-27/28

A great deal of attention is also paid to the physical interpretation of problems. A sufficient number of sample problems are added. The book has 12 sections with 44 chapters. A short summary of each chapter is given, and rare shortcomings are indicated.

zhimnyye patrozy dlya revol'vernykh stankov)

PERIODICAL: Vestnik Mashinostroyeniya, 1958, Nr 6, pp 64-67 (USSR)

ABSTRACT: Several designs of pneumatic collets are described wherein the pneumatic cylinder surrounds the collet and the clamping mechanism is actuated directly by the cylinder without a central push-pull element. Cross-sectional drawings are reproduced of 4 different designs with different cylinder arrangements and wedging mechanisms. The two larger sizes have housings attached to the spindle stock.
There are 4 figures.

TEXT DATA

Coverage: This monograph deals with the manufacturing of machine elements out of sheet metal by means of cold stamping with little or no waste of material. The author explains how to save materials by the efficient laying out of patterns for stamping forms out of a strip. This method is now widely used in the Soviet Union. The monograph contains detailed descriptions of the processing and equipment, with illustrations, diagrams and tables.

RELAXATION OF AUSTENITIC STEEL AT ROOM TEMPERATURE. (In Russian.) I. A. Odintsov and E. N. Vukobratov. Doklady Akademii Nauk SSSR (Reports of the Academy of Sciences of the USSR), new ser., v. 71, Apr. 1, 1950, p. 659-662.

The above was investigated for an 18-8 austenitic steel and low-carbon α -iron. Relaxation was determined under initial stresses of 5, 10, 15, 20, 35, and 42 kg. per sq. mm. over a period of 1600 hours. Data are charted and discussed and their practical application indicated.

CA

Relaxation of austenitic steel at room temperature
 I. A. Odling and E. N. Volynskaya. Doklady Akad.
 Nauk S.S.S.R. 71, 650-62 (1959). -- An expl. study on ring
 specimens was made of the room-temp. relaxation of low-C
 iron normalized at 950° and of 18-8 stainless steel water
 quenched from 1150°. The iron showed no relaxation in
 1000 hrs. at stresses up to 10 kg./sq. mm., but 18-8
 showed relaxation at all stresses in the range of 8 to 42
 kg./sq. mm. At an initial stress of 31 kg./sq. mm. the
 stress decreased to 23 kg./sq. mm. In almost all instances
 the decrease occurred during the first 100 hrs. of the test.
 Five other austenitic steels tested also relaxed. On suc-
 cessive restressing the amt. of relaxation decreased, so
 that when 18-8 was stressed to 42 kg./sq. mm. for the
 sixth time almost no relaxation occurred. Creep in aus-
 tenitic steels may be responsible for more than a 10%
 decrease in Young's modulus detd. from stress-strain re-
 lations.
